

GET THE MOST OUT OF YOUR PANEL PRODUCTS

It is very important to remember the following steps during and immediately after installation to ensure your material looks great for years to come!

SWEEP THE SHEETS

During the installation of metal panels, raw metallic particles land on the surface of the panel. When these raw particles come into contact with moisture, red rust will occur giving the appearance that the panel is rusting when in reality, it is the particles that exhibit the rust characteristics.

PEEL THE TRIM

All Metal Mart painted trim comes with a factory installed plastic protective film to help reduce scratches during fabrication. It is imperative that the film be removed before final installation. Failure to do so will result in an unsightly appearance.

LIMIT TOUCH UP PAINT APPLICATION

When scratches on painted panels and trim occur during installation, the scratches can be masked using touch up paint. Because the touch up paint does not have the long term durability and fade resistance characteristics of the factory applied finish, it is imperative that the absolute minimum amount of touch up paint be used by only filling the depth of the scratch and not blending a broad surface area.
